Solid State Technology:

Working with the Body's Informational Field

Solid State Technology (SST) is a scalar-based modality designed to work with the body's energetic and informational systems, helping restore coherence where disruption or distortion may be present.

The core concept behind SST is that the body is guided not only by chemistry and structure, but also by information. This information is held in the body's energy field, sometimes called the morphic field. When this field becomes distorted by stress, trauma, illness, EMF exposure, toxins, or unresolved emotional patterns, the body may lose clear communication with its own blueprint for balance.

SST uses three primary components: the BioDisk, the brass plate, and geometric overlays. The BioDisk acts as the energetic source. The brass plate functions as a waveform guide, forming the scalar wave from the BioDisk into a controlled field. The geometric overlays then modulate the frequency and information of the wave, allowing different configurations to address different types of energetic imbalance.

The Balance Protocol™, originally developed by Dr. Dan Nelson, is one of the foundational SST applications. It is designed to help balance the morphic field and reset the connection between the physical body and the informational field. Additional SST setups may be used to support areas, such as nervous system regulation, EMF clearing, digestive coherence, immune support, stress response, and post-session integration.

SST can be especially valuable when integrated with other healing modalities. It may be used alongside Emotion Code, Body Code, Belief Code, quantum biofeedback, detoxification support, bodywork, chiropractic care, or nutritional protocols. In this way, SST acts as a field-level support system, helping the body process, organize, and hold changes more effectively. ■
